

DECK FASTENING SYSTEMS

DECKMASTER® BRACKETS

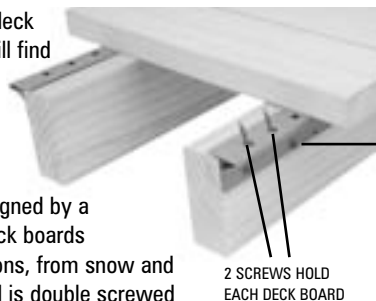

Beautiful decks—When you build a deck with Deckmaster® fasteners, you will find no unsightly nails or screws to blemish the beauty of the wood. The result is a smooth, unmarred deck surface.

The Deckmaster® fastener was designed by a professional deck builder to help deck boards withstand extreme weather conditions, from snow and ice to desert heat. Every deck board is double screwed from the bottom creating a solid, stable deck.

Construct a safer deck with Deckmaster® fasteners. There are no screws or nails to pop up as the wood shrinks. Wood splinters resulting from surface nails or screws will be a hazard of the past. Bare feet are always comfortable on the smooth surface of a deck built with Deckmaster® fasteners.

Why decks fail: with conventional deck construction, screws or nails are driven through the top of planks in wood joists. As wood weathers and shrinks, screws and nails loosen and pop up becoming hazardous and allowing water to penetrate through the deck boards and joists causing wood rot. The wood is no longer protected even if the surface has been preservative treated. Deckmaster® fasteners protect the deck surface by elimination the primary cause of deck failure—moisture penetration through exposed screw or nail holes on the top of the deck surface.

Approved for use with all species of deck wood. Including treated wood and Mobil Trex® decking.
